

YKUBERA

YKuBera WhitePaper.

Introduction :

The YKUBERA envisions an ecosystem of several Defi applications (Defi DApps) built on Binance Smart Chain for usage by both the YKUBERA team of the YKUBERA project and the decentralized community of YKUBERA product users. With that said, YKUBERA Finance is a community driven Defi-project, orchestrated to build decentralized products, with the aim of producing real Defi values to improve the YKUBERA ecosystem for the community and its users.

YKUBERA is dedicated to systematically produce new Defi products with the team acting as an ad-hoc enabled squad who will help develop, market and launch these Defi products to help grow its biosphere while simultaneously delivering desirable gains to the community, project and users.

YKUBERA can also be described as a decentralized venture capital (DVC) which empowers a decentralized interest free financial ecosystem by building Defi products invested in by its community with the aim of distributing revenue as profit shares (rewards) to stakeholders.

The YKUBERA Ecosystem will be a home to a variety of unique decentralized finance products. The YKUBERA products will be linked to its token, the YFONE Token, in the quest to re-create the true meaning of decentralized finance.

The YFONE token's major use case will be as the only governance token for each product which will give holders a claim over the revenue generated by those products.

It will be a platform for staking YFONE tokens while the YKUBERA team builds the marketplace and subsequently, the holders benefit immensely just from holding the token.

Imagine more than 1000 decentralized applications linked to one ecosystem by forking with partners and by Building from scratch it's all integrated with YFO Token. This ecosystem will be extremely large and continually grow It is a completely decentralized system, and it is constantly growing, that is the true meaning of Defi.

DEFI GENERAL PROBLEMS :

One might have thought that the recent increase in scam rates of Defi projects might be a major problem hindering Defi products or services from scaling higher and going mainstream. However, it is not a major problem nor is it the reason why Defi projects haven't gained so much acceptance even though they have gained much attention. All that notwithstanding, scams by projects/teams are definitely problems of Defi and we have seen a lot of cases where projects dump tokens on their communities/token holders, and exit without fulfilling promises made.

As soon as Defi made the headlines for better use cases of blockchain technology utilizing the Binance Smart Chain ecosystem, most people jumped into it without thorough understanding as to what they could achieve. Projects rose up to make quick bucks. We saw cases of CEOs leaving the projects after exit scams. What could have been the most spectacular experience for communities and cryptocurrency investors became what investors saw as fuzz. Instead of building solutions using Defi to sustain a scalable ecosystem, they generated problems that the YKUBERA project intends to solve.

YKUBERA SOLUTIONS :

There are so many questions to ask as regards why Defi projects can't really sustain themselves with the increasing downtrend of their tokens despite the huge Defi hype and being listed on top exchanges. However, the real question is how many developers/projects are really building blockchain solutions to improve the way decentralized financial products exist? Projects and their developers are meant to ensure seamless utilization of these applications for users to integrate them into their business thereby unleashing the full service scale of Defi.

The main hindrance leading up to Defi's inability to get mainstream attention is the fact that projects are not building intuitive Defi products that can be used even by newbies on blockchain to witness the full potential of decentralized finance and growth. The YKUBERA team is bringing a solution to this by creating diverse Defi products that will increase the values of both the Defi and YKUBERA ecosystems. This solution will empower you to benefit from simply holding the tokens while the projects grow via the numerous decentralized finance products.

YKUBERA MODEL :

YKUBERA will commence with building 4 flagship decentralized finance applications (Defi-Apps). These products will be fabricated such that token holders can utilize them seamlessly without hassles and newbies can easily be oriented for better usage.

Since the token will have a full governance mechanism for community decisions, every milestone achieved will always be a motion set by the community because they'll have to vote for all initiatives.

It will drive us closer to the next phase on our roadmap as it would help narrow down the next course of action required to achieve our end goal which is to cause a paradigm shift on Defi products.

We plan to construct these first Defi products to enable us to leverage on and build dedicated communities of Defi lovers, supporters, investors who in turn will improve the product usage.

We have envisaged products that should resolve a number of problems regarding wallet, farming, swap and much more.

All of the above will be orchestrated by the YKUBERA team to facilitate successful product launch and integration. The dedicated team and the early adopters who are actively involved in supporting these platforms will immensely benefit from the value system of our business model both financially and through its usability.

YKUBERA Ecosystem :

The YKUBERA Products :

- Decentralized wallet.
- Decentralized exchange.
- Decentralized swap platform.
- Decentralized stake.
- Yield farming.

Application In Several Verticals :

YKUBERA DeFi will be applied in many verticals:

DeFi based DEX development.

Decentralized insurance applications.

Decentralized staking platform.

Cryptocurrency Defi Wallet.

DeFi based lending/borrowing Platform.

Conclusion and summary :

YKUBERA will employ result oriented modules like milestones, completed tasks and other measurement metrics to ensure transparency and to keep us in sync with our community as they are the major drivers of the project.

We are very optimistic that YKUBERA will have the kind of forward momentum that will be well balanced in terms of operations and expectations from both the team and the community.

YKUBERA is a project that aims to build several Defi applications from vague thoughts into completed Defi applications. We are intent on developing platforms to help Defi get recognized by mainstream users.

As we aim to accomplish our vision, we have set in place fascinating ways to maintain consistent execution of each goal by creating reward systems for members of the community, investors, and the general public.

The consistency will be upheld by an efficiently coordinated management to systematize the ecosystem as well as a well thought-out business model to improve and add monetary values to the project in its entirety. The completion of each item on the roadmap will validate trust, our trust is the platform, the platform is our community.
